- Graph Coloring

# Definitions - Graph

A generalization of the simple concept of a set of dots, links, edges or arcs.

*Representation: Graph  $G = (V, E)$  consists set of vertices denoted by  $V$ , or by  $V(G)$  and set of edges  $E$ , or  $E(G)$*

# Definitions – Edge Type

**Directed:** **Ordered pair of vertices.** Represented as  $(u, v)$  directed from vertex  $u$  to  $v$ .

**Undirected:** **Unordered pair of vertices.** Represented as  $\{u, v\}$ . Disregards any sense of direction and treats both end vertices interchangeably.

# Definitions – Edge Type

- **Loop:** A loop is an edge whose endpoints are equal i.e., an edge joining a vertex to it self is called a loop. Represented as  $\{u, u\} = \{u\}$

- **Multiple Edges:** Two or more edges joining the same pair of vertices.

# Definitions – Graph Type

- Simple (Undirected) Graph: consists of  $V$ , a nonempty set of vertices, and  $E$ , a set of unordered pairs of distinct elements of  $V$  called edges (undirected)
- Representation Example:  $G(V, E)$ ,  $V = \{u, v, w\}$ ,  $E = \{\{u, v\}, \{v, w\}, \{u, w\}\}$

# Definitions – Graph Type

**Multigraph:**  $G(V,E)$ , consists of set of vertices  $V$ , set of Edges  $E$  and a function  $f$  from  $E$  to  $\{\{u, v\} \mid u, v \in V, u \neq v\}$ . The edges  $e_1$  and  $e_2$  are called multiple or parallel edges if  $f(e_1) = f(e_2)$ .

Representation Example:  $V = \{u, v, w\}$ ,  $E = \{e_1, e_2, e_3\}$

# Definitions – Graph Type

**Pseudograph:**  $G(V,E)$ , consists of set of vertices  $V$ , set of Edges  $E$  and a function  $F$  from  $E$  to  $\{\{u, v\} \mid u, v \in V\}$ . Loops allowed in such a graph.

Representation Example:  $V = \{u, v, w\}$ ,  $E = \{e_1, e_2, e_3, e_4\}$

# Definitions – Graph Type

**Directed Graph:**  $G(V, E)$ , set of vertices  $V$ , and set of Edges  $E$ , that are ordered pair of elements of  $V$  (directed edges)

Representation Example:  $G(V, E)$ ,  $V = \{u, v, w\}$ ,  $E = \{(u, v), (v, w), (w, u)\}$

# Definitions – Graph Type

**Directed Multigraph:**  $G(V,E)$ , consists of set of vertices  $V$ , set of Edges  $E$  and a function  $f$  from  $E$  to  $\{\{u, v\} \mid u, v \in V\}$ . The edges  $e_1$  and  $e_2$  are multiple edges if  $f(e_1) = f(e_2)$

Representation Example:  $V = \{u, v, w\}$ ,  $E = \{e_1, e_2, e_3, e_4\}$

# Definitions – Graph Type

Type	Edges	Multiple Edges Allowed ?	Loops Allowed ?
<b>Simple Graph</b>	undirected	No	No
<b>Multigraph</b>	undirected	Yes	No
<b>Pseudograph</b>	undirected	Yes	Yes
<b>Directed Graph</b>	directed	No	Yes
<b>Directed Multigraph</b>	directed	Yes	Yes

Question : Graph Type ??

# Terminology — Undirected graphs

- $u$  and  $v$  are **adjacent** if  $\{u, v\}$  is an edge,  $e$  is called **incident** with  $u$  and  $v$ .  $u$  and  $v$  are called **endpoints** of  $\{u, v\}$
- **Degree of Vertex ( $\deg(v)$ )**: the number of edges incident on a vertex. A loop contributes twice to the degree (why?).

- **Pendant Vertex**:  $\deg(v) = 1$

- **Isolated Vertex**:  $\deg(k) = 0$

**Representation Example:** For  $V = \{u, v, w\}$ ,  $E = \{\{u, w\}, \{u, w\}, (u, v)\}$ ,  $\deg(u) = 2$ ,  $\deg(v) = 1$ ,  $\deg(w) = 1$ ,  $\deg(k) = 0$ ,  $w$  and  $v$  are pendant,  $k$  is isolated

# Terminology — Directed graphs

- For the edge  $(u, v)$ ,  $u$  is **adjacent to**  $v$  OR  $v$  is **adjacent from**  $u$ ,  $u$  — **Initial vertex**,  $v$  — **Terminal vertex**
- **In-degree** ( $\text{deg}^- (u)$ ): number of edges for which  $u$  is terminal vertex
- **Out-degree** ( $\text{deg}^+ (u)$ ): number of edges for which  $u$  is initial vertex

*Note: A loop contributes 1 to both in-degree and out-degree (why?)*

**Representation Example:** For  $V = \{u, v, w\}$ ,  $E = \{(u, w), (v, w), (u, v)\}$ ,  $\text{deg}^- (u) = 0$ ,  $\text{deg}^+ (u) = 2$ ,  $\text{deg}^- (v) = 1$ ,

$\text{deg}^+ (v) = 1$ , and  $\text{deg}^- (w) = 2$ ,  $\text{deg}^+ (w) = 0$

Question :  $\deg^-()$  and  $\deg^+()$  of all vertices

# Theorems: Undirected Graphs

## Theorem 1

The Handshaking theorem:

∑ degree of vertices  
= 2 \* number of edges

$$2e = \sum_{v \in V} \deg(v)$$

(why?) Every edge connects 2 vertices

$\sum \text{degree} = 4$

$e = 2$

# Theorems: Undirected Graphs

## Theorem 2:

An undirected graph has even number of vertices with odd degree

*Proof*  $V_1$  is the set of even degree vertices and  $V_2$  refers to odd degree vertices

$$2e = \sum_{v \in V} \deg(v) = \sum_{u \in V_1} \deg(u) + \sum_{v \in V_2} \deg(v)$$

$\Rightarrow \deg(v)$  is even for  $v \in V_1$ ,

$\Rightarrow$  The first term in the right hand side of the last inequality is even.

$\Rightarrow$  The sum of the last two terms on the right hand side of the last inequality is even since sum is  $2e$ .

Hence second term is also even

$\Rightarrow$  second term  $\sum_{v \in V_2} \deg(v) = \text{even}$

# Theorems: directed Graphs

- Theorem 3:  $\sum \deg^+(u) = \sum \deg^-(u) = |E|$

1 direct van 1 lab  $\propto$

Complete graph  $\rightarrow$  เชื่อมกันหมด  $K_n$

# Complete Bipartite graphs

గ్రాఫ్

2 గ్రాఫ్

- $K_{m,n}$  is the graph that has its vertex set partitioned into two subsets of  $m$  and  $n$  vertices, respectively. There is an edge between two vertices if and only if one vertex is in the first subset and the other vertex is in the second subset.

Representation example:  $K_{2,3}$ ,  $K_{3,3}$

# Subgraphs

ပေါင်းစပ်မှု

အပိုင်း

- A subgraph of a graph  $G = (V, E)$  is a graph  $H = (V', E')$  where  $V'$  is a subset of  $V$  and  $E'$  is a subset of  $E$

Application example: solving sub-problems within a graph

Representation example:  $V = \{u, v, w\}$ ,  $E = (\{u, v\}, \{v, w\}, \{w, u\})$ ,  $H_1$ ,  $H_2$

G

$H_1$

$H_2$

# Subgraphs

↗ ခုတ်ခွာပုံရိပ်  
↘ ခုတ် edge , vector ချိတ်ဆက်

- $G = G1 \cup G2$  wherein  $E = E1 \cup E2$  and  $V = V1 \cup V2$ ,  $G$ ,  $G1$  and  $G2$  are simple graphs of  $G$

Representation example:  $V1 = \{u, w\}$ ,  $E1 = \{\{u, w\}\}$ ,  $V2 = \{w, v\}$ ,  
 $E2 = \{\{w, v\}\}$ ,  $V = \{u, v, w\}$ ,  $E = \{\{u, w\}, \{w, v\}\}$

G1

G2

G

# Representation

column = edge  
row = node  
matrix node x edge  
edge 1 2 3 4 5 node 1 2 3

- **Incidence (Matrix):** Most useful when information about edges is more desirable than information about vertices.

directed/undirected  
matrix node x node

- **Adjacency (Matrix/List):** Most useful when information about the vertices is more desirable than information about the edges. These two representations are also most popular since information about the vertices is often more desirable than edges in most applications

# Representation- Incidence Matrix

- $G = (V, E)$  be an undirected graph. Suppose that  $v_1, v_2, v_3, \dots, v_n$  are the vertices and  $e_1, e_2, \dots, e_m$  are the edges of  $G$ . Then the incidence matrix with respect to this ordering of  $V$  and  $E$  is the  $n \times m$  matrix  $M = [m_{ij}]$ , where

$$m_{ij} = \begin{cases} 1 & \text{when edge } e_j \text{ is incident with } v_i \\ 0 & \text{otherwise} \end{cases}$$

Can also be used to represent :

**Multiple edges:** by using columns with identical entries, since these edges are incident with the same pair of vertices

**Loops:** by using a column with exactly one entry equal to 1, corresponding to the vertex that is incident with the loop

# Representation- Incidence Matrix

- Representation Example:  $G = (V, E)$

	$e_1$	$e_2$	$e_3$
$v$	1	0	1
$u$	1	1	0
$w$	0	1	1

# Representation- Adjacency Matrix

- There is an  $N \times N$  matrix, where  $|V| = N$ , the Adjacent Matrix ( $N \times N$ )  $A = [a_{ij}]$

**For undirected graph**

$$a_{ij} = \begin{cases} 1 & \text{if } \{v_i, v_j\} \text{ is an edge of } G \\ 0 & \text{otherwise} \end{cases}$$

- **For directed graph**

$$a_{ij} = \begin{cases} 1 & \text{if } (v_i, v_j) \text{ is an edge of } G \\ 0 & \text{otherwise} \end{cases}$$

- This makes it easier to find subgraphs, and to reverse graphs if needed.

# Representation- Adjacency Matrix

- Adjacency is chosen on the ordering of vertices. Hence, there are as many as  $n!$  such matrices.
- The adjacency matrix of simple graphs are symmetric ( $a_{ij} = a_{ji}$ ) (why?)
- When there are relatively few edges in the graph the adjacency matrix is a **sparse matrix**
- Directed Multigraphs can be represented by using  $a_{ij}$  = number of edges from  $v_i$  to  $v_j$

# Representation- Adjacency Matrix

- Example: Undirected Graph  $G(V, E)$

	v	u	w
v	0	1	1
u	1	0	1
w	1	1	0

# Representation- Adjacency Matrix

# Connectivity

- Basic Idea: In a Graph Reachability among vertices by traversing the edges

## Application Example:

- In a city to city road-network, if one city can be reached from another city.
- Problems if determining whether a message can be sent between two computer using intermediate links
- Efficiently planning routes for data delivery in the Internet

# Connectivity – Path – set of edges $\rightarrow$ sequence of vertices

A **Path** is a sequence of edges that begins at a vertex of a graph and travels along edges of the graph, always connecting pairs of adjacent vertices.

Representation example:  $G = (V, E)$ , Path  $P$  represented, from  $u$  to  $v$  is  $\{\{u, 1\}, \{1, 4\}, \{4, 5\}, \{5, v\}\}$

path undirected graph's directed graph's

# Connectivity – Path

## Definition for Directed Graphs

A **Path** of length  $n$  ( $> 0$ ) from  $u$  to  $v$  in  $G$  is a sequence of  $n$  edges  $e_1, e_2, e_3, \dots, e_n$  of  $G$  such that  $f(e_1) = (x_0, x_1)$ ,  $f(e_2) = (x_1, x_2)$ , ...,  $f(e_n) = (x_{n-1}, x_n)$ , where  $x_0 = u$  and  $x_n = v$ . A path is said to pass through  $x_0, x_1, \dots, x_n$  or traverse  $e_1, e_2, e_3, \dots, e_n$

For Simple Graphs, sequence is  $x_0, x_1, \dots, x_n$

In directed multigraphs when it is not necessary to distinguish between their edges, we can use sequence of vertices to represent the path

**Circuit/Cycle:**  $u = v$ , length of path  $> 0$

**Simple Path:** does not contain an edge more than once

# Connectivity – Connectedness

↓  
ရရှိသည့် simple path မှာ node တိုက်ရိုက်

## Undirected Graph

An undirected graph is connected if there exists a simple path between every pair of vertices

Representation Example:  $G(V, E)$  is connected since for  $V = \{v_1, v_2, v_3, v_4, v_5\}$ , there exists a path between  $\{v_i, v_j\}$ ,  $1 \leq i, j \leq 5$

# Connectivity – Connectedness

## Undirected Graph

- **Articulation Point (Cut vertex):** removal of a vertex produces a subgraph with more connected components than in the original graph. The removal of a cut vertex from a connected graph produces a graph that is not connected
- **Cut Edge:** An edge whose removal produces a subgraph with more connected components than in the original graph.

Representation example:  $G(V, E)$ ,  $v_3$  is the articulation point or edge  $\{v_2, v_3\}$ , the number of connected components is 2 ( $> 1$ )

ลองหว่า ถ้ามีเส้นทางเชื่อมระหว่าง node ใด node หนึ่ง

# Connectivity – Connectedness

## Directed Graph

- A directed graph is **strongly connected** if there is a path from a to b and from b to a whenever a and b are vertices in the graph
- A directed graph is **weakly connected** if there is a (undirected) path between every two vertices in the underlying undirected path

เชื่อมกันได้ทั้งสองทาง

เชื่อมกันได้ทางเดียว

# Connectivity – Connectedness

## Directed Graph

Representation example: G1 (Strong component), G2 (Weak Component), G3 is undirected graph representation of G2 or G1

G1

G2

## The Seven Bridges of Königsberg, Germany

- The residents of Königsberg, Germany, wondered if it was possible to take a walking tour of the town that crossed each of the seven bridges over the Presel river exactly once. Is it possible to start at some node and take a walk that uses each edge exactly once, and ends at the starting node?

# The Seven Bridges of Königsberg, Germany

You can redraw the original picture as long as for every edge between nodes  $i$  and  $j$  in the original you put an edge between nodes  $i$  and  $j$  in the redrawn version (and you put no other edges in the redrawn version).

Redrawn:

สามารถวาดใหม่ได้

# The Seven Bridges of Königsberg, Germany

Euler:

- Has no tour that uses each edge exactly once.
- (Even if we allow the walk to start and finish in different places.)
- Can you see why?

# Euler - definitions

- An **Eulerian path** (**Eulerian trail**, **Euler walk**) in a graph is a path that uses each edge precisely once. If such a path exists, the graph is called **traversable**.  
(เขียนเส้นผ่านทุกเส้น)
- An **Eulerian cycle** (**Eulerian circuit**, **Euler tour**) in a graph is a cycle that uses each edge precisely once. If such a cycle exists, the graph is called **Eulerian** (also **unicursal**).  
(เขียนครบ X จบที่ X เดิม)
- Representation example: G1 has Euler path a, c, d, e, b, d, a, b

The problem in our language:

Show that is not Eulerian.

In fact, it contains no Euler trail.

រូបរាងខ្សែរង្វង់

រូបរាងដែលមានកំពូលស្មើគ្នា  
ហើយមានខ្សែរង្វង់ត្រឹមត្រូវ

# Euler - theorems

1. A connected graph  $G$  is Eulerian if and only if  $G$  is connected and has no vertices of odd degree
2. A connected graph  $G$  has an Euler trail from node  $a$  to some other node  $b$  if and only if  $G$  is connected and  $a \neq b$  are the only two nodes of odd degree

ករណីដែលរូបរាង គឺជា ២ កំពូល (connect graph)  
ករណីដែលរូបរាងខ្សែរង្វង់

→ จะเป็น path ที่ใช้ผ่านได้ทุก node

→ สามารถใช้ผ่านได้ทุก node

- **Hamiltonian path** (also called *traceable path*) is a path that visits each vertex exactly once.
- A **Hamiltonian cycle** (also called *Hamiltonian circuit*, *vertex tour* or *graph cycle*) is a cycle that visits each vertex exactly once (except for the starting vertex, which is visited once at the start and once again at the end).
- A graph that contains a Hamiltonian path is called a **traceable graph**. A graph that contains a Hamiltonian cycle is called a **Hamiltonian graph**. Any Hamiltonian cycle can be converted to a Hamiltonian path by removing one of its edges, but a Hamiltonian path can be extended to Hamiltonian cycle only if its endpoints are adjacent.

A graph of the vertices of a dodecahedron.

Is it Hamiltonian?

# Hamiltonian Graph

This one has a Hamiltonian path, but not a Hamiltonian tour.

# Hamiltonian Graph

This one has an Euler tour, but no Hamiltonian path.
