PROOF TECHNIQUES

Proof by induction

Proof by contradiction

Induction

We have statements P_1 , P_2 , P_3 , ... P_3 , ...

If we know

- for some b that P_1 , P_2 , ..., P_b are true
- for any k >= b that

$$P_1, P_2, ..., P_k$$
 imply P_{k+1}

Then

Every P_i is true

Proof by Induction

Inductive basis

Find P₁, P₂, ..., P_b which are true

Inductive hypothesis

Let's assume P_1 , P_2 , ..., P_k are true, for any $k \ge b$

Inductive step

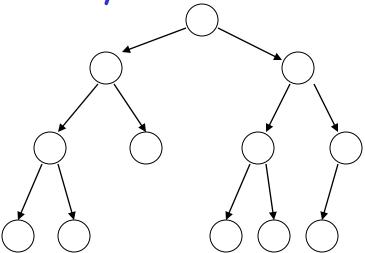

Show that P_{k+1} is true

Example

Theorem: A binary tree of height n has at most 2ⁿ leaves.

Proof by induction:

let L(i) be the maximum number of leaves of any subtree at height i

Inductive basis

$$L(0) = 1$$
 (the root node)

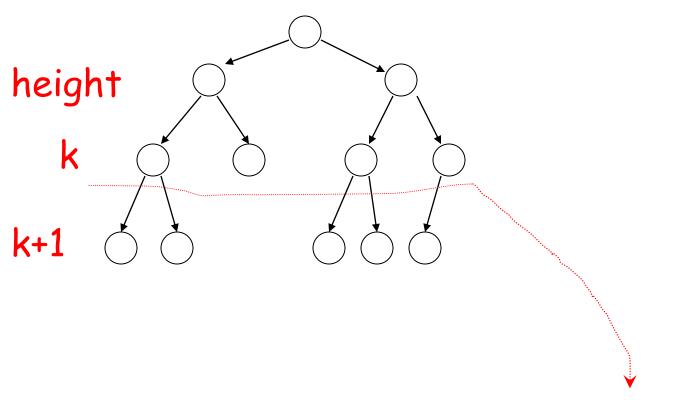

Inductive hypothesis

Let's assume
$$L(i) \leftarrow 2^i$$
 for all $i = 0, 1, ..., k$

Induction step

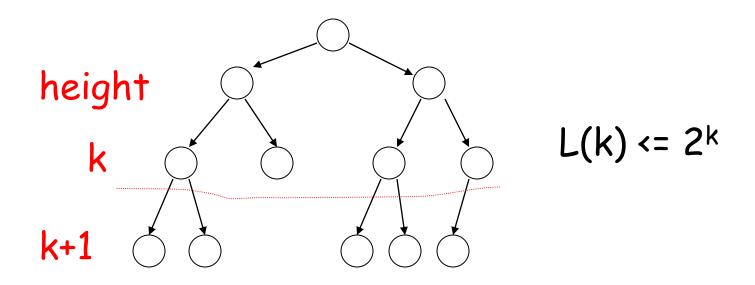

we need to show that
$$L(k + 1) \leftarrow 2^{k+1}$$

Induction Step

From Inductive hypothesis: $L(k) \leftarrow 2^k$

Induction Step

$$L(k+1) \leftarrow 2 * L(k) \leftarrow 2 * 2^{k} = 2^{k+1}$$

(we add at most two nodes for every leaf of level k)

Proof by Contradiction

We want to prove that a statement P is true

- we assume that P is false
- · then we arrive at an incorrect conclusion
- therefore, statement P must be true

Example

Theorem: $\sqrt{2}$ is not rational

Proof:

Assume by contradiction that it is rational

$$\sqrt{2}$$
 = n/m

n and m have no common factors

We will show that this is impossible

$$\sqrt{2} = n/m \qquad \implies 2 m^2 = n^2$$

Therefore,
$$n^2$$
 is even $n = 2 k$

Thus, m and n have common factor 2

Contradiction!
